Excerpt: . . . small lead ball suspended by a fine silk string may for most experiments be regarded as a simple pendulum. A Compound Pendulum is a mass of any shape oscillating round a fixed axis. 153. When the ranges are very small compared with the length of the pendulum, the time of a vibration does not depend on the length of the range. Galileo was the first to observe this fact, and to apply the pendulum to measure equal intervals of time. It becomes of great importance therefore to determine on what the time of vibration of a pendulum depends and we proceed to find an expression for the time of vibration of a Simple Pendulum when oscillating in small arcs. 154. To find the time of vibration of a simple pendulum. Let A be a material particle suspended from O by a string OA, supposed to be without weight, and let it oscillate in an arc BB so small that the arcs BA, CA may be regarded as coinciding with their chords. Let OA J, BA a, CA x. At any point C let the velocity be called v, and at A be V; then (Art. 152) the velocity at B is zero; the velocity v at C V27-DE (a2-ond the velocity V at A. VZg. J)A a f Let BCAB be a straight line equal to the arc BB, and let a particle oscillate on this straight line with the same velocities as the pendulum...
